C/Comment: Plasmin is inactivated by alpha-2-antiplasmin (see PIR:ITHUA2) immediately af C/Comment: Plasmin is inactivated by two disulfide bonds. Without the inhibitor, rg-580, resulting in two chains connected by two disulfide bonds. Without the inhibitor, C/Comment: Microplasmin is formed by autolytic cleavage of plasmin under artificial cond C/Comment: Stromelysin 1 (see PIR:KCHUS1) acts on plasminogen to produce angiostatin. A;Residues: 22-27 <LI2>
C;Comment: Plasminogen is synthesized by the kidney and is present in plasma and many oth
C;Comment: Plasminogen is converted into plasmin by plasminogen activators, both plasminc
mediately after dissociation from the clot. In the presence of the inhibitor, the activat
e inhibitor, the activation involves also removal of the activation peptide.
c;Comment: Stromelysin I (see PIR:KCMSSI) acts on plasminogen to produce angiostatin. To:

A;Description: Cloning and characterizatin of the bovine plasminogen cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   F;78-79/Cleavage site: Glu-Asm (stromelysin 1) #status predicted F;136,308/Binding site: carbohydrate (Asm) (covalent) #status predicted F;466-467/Cleavage site: Thr-Val (stromelysin 1) #status predicted F;581-582/Cleavage site: Arg-Val (plasminogen activator) #status experier;624,667,762/Active site: His, Asp, Ser #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Description: dissolves the fibrin of blood clots; acts as a proteolytic factor in a vains the walls of the graafian follicle; also activates the urokinase-type plasminogen activates the urokinase-type plasminogen. Superfamily: plasmin; kringle homology; plasminogen-related protein precursor homology; C;Keywords: angiogenesis inhibitor; blood; duplication; fibrinolysis; glycoprotein; hydrominogen activates and the urokinase type plasminogen.
A; Experimental source: liver A; Note: it is uncertain whether Met-1 or Met-8 is the initiator R; Schaller, J.; Moser, P.W.; Dannegger-Muller, G.A.K.; Rosselet,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plasmin (EC 3.4.21.7) precursor - bovine N;Alternate names: plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PRODUCTS.

ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO FIBRIN. ACTIVATED WITH CATALYTIC AMOUNTS OF STREPTOKINASE.

MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN IS INMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

MISCELLANEOUS: IN THE PRESENCE OF THE INHIBITOR, THE ACTIVATION INVOLVES ONLY CLEAVAGE AFTER ARG-580, RESULTING IN 2 CHAINS HELD TOGETHER BY 2 DISULFIDE BONDS. WITHOUT THE INHIBITOR, THE ACTIVATION INVOLVES ALSO REMOVAL OF THE ACTIVATION PEPTIDE.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. PLASMINOGEN SUBFAMILY.

SIMILARITY: Contains 5 kringle domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAAFIAN FOOLICLE. IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND CS. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LAMININ AND VON WILLEBRAND FACTOR.

CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-higher selectivity than trypsin. Converts fibrin into soluble

-I- FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS
A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION,
AND INFLAMMATION; IN OVULATION IT MEAKENS THE WALLS OF THE
GRAAFIAN FOLLICLE. IT ACTIVATES THE UROXINASE-TYPE PLASMINOGEN
ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH
AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN,
                                                                                      ACT_SITE

-!- EUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION,

AND INFLAMMATION; IN OVULATION IT WEAKENS THE MALLS OF THE GRAAFIAN FOLLICLE. IT ACTIVATES THE URCKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS C1 AND C5. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.

A PROTEOLYTIC FACTOR IN A VARIETY OF BLOOD CLOTS AND ACTS AS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION, EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION, EMBRYONIC DEVELOPMENT, TISSUE REMODELING, TUMOR INVASION, EMBRYONIC IT ACTIVATES THE UROKINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENASES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH AS CI AND CS. IT CLEAVES FIBRIN, FIBRONECTIN, THROMBOSPONDIN, LAMININ AND VON WILLEBRAND FACTOR.

-I- FUNCTION: ANGIOSTATIN IS AN ANGIOGENESIS INHIBITOR THAT BLOCKS NEOVASCULARIZATION AND GROWTH OF EXPERIMENTAL PRIMARY AND METASTATIC TUMORS IN VIVO.

-I- CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa; higher selectivity than trypsin. Converts fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CHARACTERIZATION OF ANGIOSTATIN, AND PARTIAL MEDLINE=95042728; PubMed=7525077; O'Reilly M.S., Holmgren L., Shing Y., Chen C. Moses M., Lane W.S., Cao Y., Sage E.H., Folkm "Angiostatin: a novel angiogenesis inhibitor suppression of metastases by a Lewis lung car Cell 79:315-328(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Richards S., Worley K.C., Hale S., Garcia A.M., Gay L.J., H Villalon D.K., Muzny D.M., Sodergren E.J., Lu X., Gibbs R.A Fahey J., Helton B., Ketteman M., Madan A., Rodrigues S., S Whiting M., Madan A., Young A.C., Shevchenko Y., Bouffard Glakeeley R.W., Touchman J.W., Green E.D., Dickson M.C., Rodriguez A.C., Grimwood J., Schmutz J., Myers R.M., Butterfield Y.S.N., Krzywinski M.I., Skalska U., Smailus D. PRODUCT CONVERTED INTO PLASMIN BY PLASMINOGEN
ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
PIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

PIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

PIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

PIBRIN. CANNOT BE ACTIVATED BY ALPHA-2-ANTIPLASMIN IS INACTIVATED FOR THE CLOT.

PIMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

PIMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

PIMEDIATELY AFTER PRESENCE OF THE INHIBITOR, THE ACTIVATION LOSS BOUNDS. WITHOUT THE INHIBITOR, THE TOGETHER BY 2 DISTULFIDE BONDS. WITHOUT THE INHIBITOR, THE ACTIVATION PROPIDES.

PACTIVATION INVOLVES ALSO REMOVAL OF THE ACTIVATION DEPTIDE.

PRODUCT OF THE ACTIVATION OF THE PROPIDES.

PIMILARITY: CONTAINS 5 KRINGLE FAMILY S1. PLASMINOGEN SUBFAMIL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               <del>:</del>

ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO FIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

PTM: N-LINKED GLYCAN CONTAIN N-ACETYLLACTOSAMINE AND SIALIC ACID.

O-LINKED GLYCANS CONSIST OF GAL-GALNAC DISACCHARIDE WITH IS MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES (MICKOHETEROGENEITY).

MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

SIMILARITY: BELONGS TO PEPTIPLASE FAMILY S1. PLASMINOGEN SUBFAMIL.

ENZYME REGULATION: CONVERTED INTO PLASMIN BY PLASMINOGEN
ACTIVATORS, BOTH PLASMINOGEN AND ITS ACTIVATOR BEING BOUND TO
FIBRIN. CANNOT BE ACTIVATED WITH STREPTOKINASE.

MISCELLANEOUS: PLASMIN IS INACTIVATED BY ALPHA-2-ANTIPLASMIN
IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. PLASMINOGEN SUBFAMILY.
SIMILARITY: Contains 5 kringle domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LAMININ AND VON WILLEBRAND FACTOR.

CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa; higher selectivity than trypsin. Converts fibrin into soluble
